

A customizable class of colloidal-quantum-dot spasers and plasmonic amplifiers

Pjotr Straver & Federico Periotto
24 November 2025

Introduction

Laser

CdSe/CdS/ZnS

Spaser

Surface Plasmon Amplification by
Stimulated Emission of Radiation

Old approaches

- Top: hard extraction of the cavity plasmons
- Bottom: not easily adaptable to a broader class of useful colloidal nanomaterial

New approach

Hybrid strategy engineering separately the plasmonic cavity and the gain medium.

Device fabrication

1. Create aberration-corrected plasmonic cavities (>90% reflectivity)
2. Incorporate quantum dots into the cavities

Photoexcitation generate monochromatic plasmons

Characterization of spasing

Results

Extracting the spaser signal

Extending a reflector **tapering** the waveguide.

Extracting the spaser signal

Extracted, guided, and focused signal at the tip.

Conclusions

- Spaser Works, Overcoming Losses
- Highly Adaptability and Flexible Design
- Scalable Fabrication
- On-Chip Integration

[illegible]

Device fabrication

1. **create aberration-corrected plasmonic cavities**
2. **incorporate quantum dots into the cavities**

→ **use: photoexcitation under ambient conditions generating monochromatic plasmons (above threshold)**
